

HOW LIGHT AND OUR EYES WORK

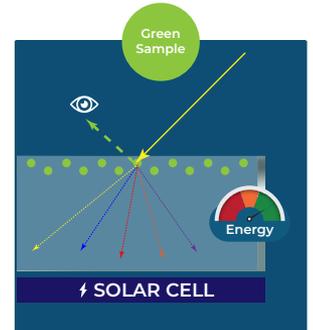

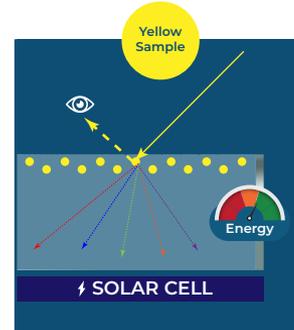

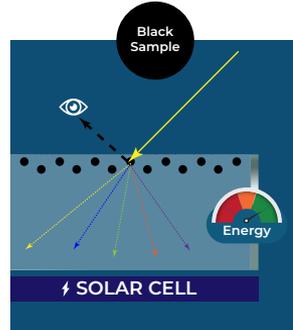

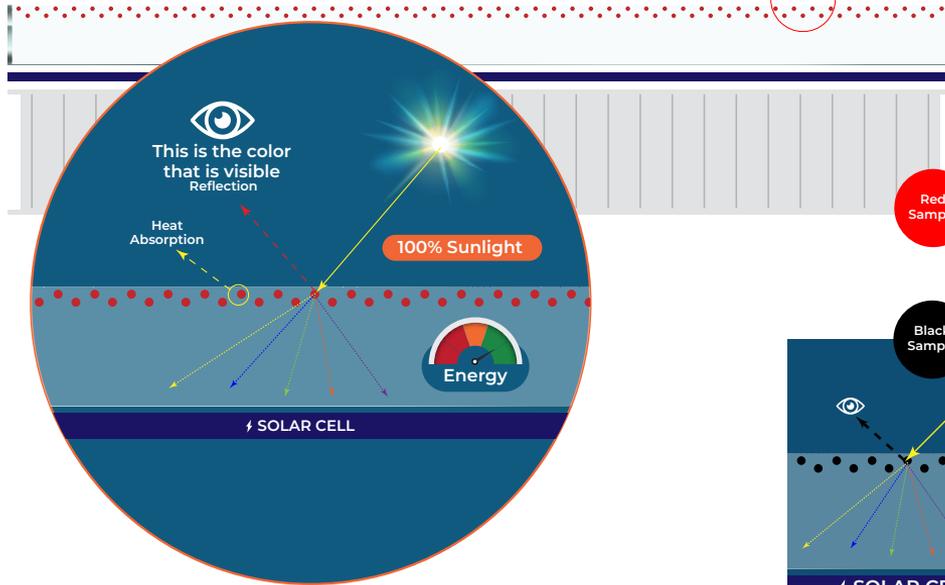

MITREX TECHNOLOGY

A single colour coating is made from all the colours from the visible colour spectrum.

Mitrex Patented Red Coating Technology

The patented Mitrex coating is embedded into the facing layer which avoids any scratch or damage to occur.

The coated facing layer absorbs all the colours except the one that is visible to the human eye. A small percentage of the energy from the sunlight is reflected, while the rest of the energy is absorbed by the solar cell and produces electricity.

The advanced coating technology allows for a customizable facing to meet any design need while maximizing energy production.
